For GAAP reporting, Medicare Part D premiums are recognized evenly throughout the year when they become due, and benefit costs are incurred. Due to the design of the product, premiums are evenly distributed throughout the year, but benefit costs are higher earlier in the year. As a result, under GAAP, benefit costs can exceed premiums in the first part of the year but be less than premiums during the remainder of the year. For net operating income purposes, Torchmark defers excess benefits incurred in earlier interim periods to later periods in order to more closely match the benefit cost with the associated revenue. For the full year, the total premiums and benefits are the same under this alternative method as they are under GAAP.
